Project description:

For our project, we would like to create a database for a discussion forum website. A discussion forum website is a place where users can sign up, log into, and talk about topics such as news, sports, videogames, education, food, etc. The database will be able to be used to host this kind of website and will allow for users to add threads (topics) to any of the available forums (categories) and in those threads the users will be able to add posts. The users will also be able to send messages to each other and add images to the website gallery. These images can later be added to posts from the gallery if the user wishes.

Simplified ERD
